

from within 5KPlayer rather than scouring your hard drive. You may also utilise Apple's AirPlay to cast videos across many devices and stream videos directly from YouTube.

The player is capable of playing almost any video format you can think of, including 360-degree and 8K films. The options for controlling music and video playback are rather flexible, albeit they don't exactly match the controls found in VLC Media Player.

AirPlay baked right in

One thing to keep in mind with 5KPlayer is that the free version has a lot of ad inserts. They won't appear when you're watching a video. However, they are present when you're searching through your collection or fiddling with settings.

PotPlayer

Pot Player is an exceptionally strong application that also ranks among the greatest free video players available. It comes with a large number of codecs and supports not just 360-degree and 8K videos, but also 3D videos. Pot Player automatically downloads the necessary codecs if you throw a file format at it that it doesn't already support.

It has a free screen recorder and a set of free video editing tools baked in, which you wouldn't find intuitively. The number of possibilities for customising video playback are astounding, and hotkeys make it easy to reach your most-used settings.

To top it off, Pot Player is a very light piece of software. It loads faster than almost any other video player, free or paid, and consumes a small amount of the computer's resources even when playing enormous movies.

Media Player Classic – Home Cinema

The new version of the classic Windows standby, Media Player Classic - Home Cinema, is also a viable option to look at. It has come a long way since its inception. In reality, the latest version is a powerful competitor to VLC Media Player and other free options
