

Those were the days

The fact that it features customisable toolbars is what really sets it apart. This software greatly simplifies access to, and use of the numerous playback modification options. While the user interface as a whole is quite basic, the menu architecture makes finding the controls you need rather simple.

This software is also incredibly light, which is quite useful.

It's meant to run on the same PCs as the original Media Player Classic, which means it only uses a little amount of computing resources. Despite this, it can play almost any media file, including 360-degree and 8K videos.

Music Players

While we all remember the old days when there was nothing other than Winamp for your music needs, the times have changed and we've got a lot many feature-rich music players now. Here are some of the best ones.

It's time to move on

MediaMonkey

If you don't like iTunes but still want an app with a lot of content management tools, and the ability to play audio and video, MediaMonkey is a good option.

The app's inbuilt tool quickly organises the music and movies scattered over your hard drive, as well as import any missing metadata of your files from the internet. MediaMonkey also provides a direct link to the Wikipedia pages of the musicians you're listening to, if you want to learn more about them. Podcasts are also supported, and the software is capable of streaming media across your home to compatible devices (such as other PCs) over the local Wi-Fi network. You'll notice many other smart features as you spend more time with the programme, such as the audio equalisation and the sleep timer, which you can use to drift off to your tunes.
