

After that, they can do whatever they want with the victim's data; they can destroy, damage, or steal it in order to demand ransom later. Antimalware solutions like Malwarebytes either impose an antihacking lock on the computer network or run frequent scans to detect the presence of any hacker or hacking-based apps.

Small stick, big damage

4. Removable Devices

Consider how many times you've used devices like USBs to move data to and from your computer. Isn't it countless?

You may have experienced computer slowdown or even a computer crash after attaching a friend's USB drive. This is because the USB or detachable device was used as a viral dissemination device. So, should you avoid using portable devices because you never know which USB can be infected?

No! Simply install antivirus software that will scan any removable devices for potential viruses, ensuring that no viruses are transported.

With that out of the way, let's take a look at all the anti-virus software that you should consider.
