

programme, but third-party software can do so much more. It's also worth noting that Defender has been known to let some infections past.

AVG

Last but not least, there's AVG Antivirus. A sleek and easy-to-understand user interface continues the trend for antivirus software. Scanning is simple because you won't have to look through menus to find the feature.

In the middle of the app, there's a big green button. AVG will actively scan for dangers hidden among file archives, check USB drives for anything harmful, and boot malware from your computer, just like the other items.

You may customise the scanning feature by selecting what you want the antivirus to scan and when you want it to scan it. It can also detect rootkits, ensuring that no one else has access.

AVG has six levels of security and doesn't slow down your machine at all. Email Shield is a feature unique to this software that detects and filters any weird links, phishing scams, or questionable email attachments.

People have stated that AVG's first scan is slower than most other antivirus programmes, and that addressing certain bugs necessitates a service upgrade.
