

LibreOffice is a fork of Apache OpenOffice, and the two are very similar. More interface customization choices, greater file import and export compatibility, and new online help pages are among the many new features and updates in the latest release of LibreOffice (version 6). Except for an Android document viewer, LibreOffice is available for Windows, Mac, and Linux. There are no official mobile versions.

WPS Office Free

WPS Office Free is a stripped-down version of a premium office suite, but it's difficult to tell. Each of its three apps has the same smooth appearance and capabilities as the current versions of Word, Excel, and PowerPoint.

You can save your work in native Microsoft formats for easy sharing with other Office users. Although there is no database software included, WPS Office does have a wonderful free PDF reader that works well as a replacement for Windows' built-in app.

There are a few ads here and there, but they're few and far between. They won't obstruct your work, and you'll quickly forget that everything in this suite is entirely free. WPS Office Free is available for Windows and Linux computers, as well as Android apps, but users of Apple devices will have to search elsewhere.

FreeOffice

Like WPS Office Free, SoftMaker FreeOffice is a free office suite. Microsoft file formats starting 1997, are supported, as is the case with all of the free office suites in our roundup. It also converts documents to PDF and Epub formats with ease, which is a nice feature.

Unfortunately, certain critical functions are only available in the software's premium edition. Some of these features (such as tabbed browsing) are good to have but not necessary.

Although FreeOffice doesn't have the same slick appearance as WPS Office, if you despise the Microsoft ribbon and find it unintuitive, you'll appreciate the slightly more traditional navigation style. **d**
