

Files

On Windows 11, the File Explorer was revamped, although it was far from perfect. Files is a Universal Windows Platform (UWP) file manager for Windows 11 that replaces the default File Explorer. It's simple to use and has an intuitive fluent design that makes it feel more current and compact.

It's different

Files also allows you to customise its design, so you may create your own unique theme or use a stunning dark mode that makes everything look classy. That's not all. Compared to the system default, Files features a considerably more sophisticated and intuitive context menu. Files is available for free download from the Microsoft Store.

BeWidgets

BeWidgets is the software you need on Windows 11 if you're a widget aficionado. It is a desktop widget creator that allows you to create fully customised, personalised widgets. In Windows 11, Microsoft added a Widgets panel, but it's not what many users had hoped for.

With BeWidgets, you may customise the weather, time, stock market, cryptocurrencies, and even application shortcuts. Its developers aim to include a music widget that can control Spotify and other media, as well as browser, RSS feed, and text widgets. BeWidgets is also available for free on the Microsoft Store.
