

You may also use this software to stress test all of your components in a wide range of combinations.

You will also have AIDA's team's full support at your disposal. Take a look at it and give it a shot.

Wise System Monitor

Another good tool for monitoring system resources is Wise System Monitor. The main tool lets you see all of your running processes as well as how much of your computer's resources they consume.

A Hardware monitor is also provided, which allows you to view all hardware-related data. You may examine specific details on your motherboard, CPU, graphics card, memory, and other components. You can also examine essential information about your operating system if you like.

The resource monitor is located in the bottom right corner of your screen, immediately above your Taskbar. The tool will show you data like download and upload speeds, RAM and CPU utilisation, and CPU temperature.

If you want more details, simply click a field and you'll see which programmes are consuming the most of that resource.

Wise System Monitor is a good tool for keeping track on your computer's resources. The tool makes all information readily available, making it ideal for novice users.

A lean, fast, processing machine
