

It explores processes

Process Explorer can also be used to keep track of system resources.

In Process Explorer, there are four graphs, each of which represents a single resource. Simply click one of the graphs to open a new window with more detailed information.

You may view the overview or examine the CPU, RAM, I/O, and GPU consumption individually from there.

This programme also includes a little graph that will appear in your Taskbar, allowing you to keep track of your system's resources at all times.

Process Explorer is not only a superb Task Manager replacement, but it can also be used to keep track of system resources. This programme is both free and portable, so give it a shot.

TinyResMeter

TinyResMeter is another easy-to-use tool for monitoring system resources. Because this is a compact and lightweight programme, it can operate on practically any computer.

Although the application's user interface isn't particularly beautiful, it will provide you with all of the information you require.

A horizontal or vertical menu can be used to display system information.
