

all of the information you need. You can see vital statistics like temperature, fan speed, and utilisation with this tool.

Although you can view information on your motherboard, CPU, graphics card, and hard disc, you don't appear to be able to see any information about your RAM or network connection.

HWMonitor, unlike the other tools on our list, does not provide a real-time graph, and you must keep the HWMonitor window active to check your system resources.

This programme provides a wealth of information on your hardware and can be really helpful if you want to learn more about your components. When it comes to resource monitoring, the tool provides practically all relevant information, although some users may have difficulty discovering what they're looking for.

HWMonitor is a good programme; it's free and portable, but it doesn't offer any information about your network connection or RAM, which is, in our opinion, its major weakness.

Moo0 System Monitor

MooO System Monitor is a free and portable system resource monitoring utility. This tool is made up of multiple graphs that display all of the relevant system data.

This programme displays CPU and GPU use and temperatures, as well as the amount of free memory, HDD temperature, and network speed.

You can also add other fields to show more information if you wish.

The tool allows for some customisation, such as changing the tool's size or transparency. You may also set this tool to auto-hide after a specified amount of inactivity.

Many different colour schemes are supported by the tool, and you can even set the colour scheme to change automatically.
