

2. Ninja Download Manager

Ninja Download Manager is a relative newcomer to the downloading scene, and it appears to be far more modern than its peers.

It has a clean, modern UI (though it is a little gloomy), and its accelerator can help you obtain your files 10 times faster. This is accomplished by breaking each file into chunks and downloading each one utilising a separate server connection, resulting in downloads that are not only faster but also more dependable. If you like music and movies, the sequential setting will excite you, since it allows you to start playing a file while it's still downloading.

There's also a built-in video downloader that supports YouTube and Vimeo, as well as a video converter that automatically converts files once they've been downloaded.

There are many excellent solutions available, but Ninja Download Manager is the programme for you if you enjoy listening to music, watching movies, or television. The Ninja Download Manager can be downloaded for free from the developer's homepage.

3. Free Download Manager

Free Download Manager aspires to be everything to everyone, and it succeeds. It's a download accelerator, a BitTorrent client, an audio and video previewer, and a traffic management tool. Plus it's fully free and gets regular upgrades from its community of developers because it's open source.

It has powerful scheduling capabilities as well as a handy remote control, allowing you to leave your downloads running and monitor their progress
