

Synchronisation

Create Synchronicity

Create Synchronicity is an open source, portable application that is essentially designed to synchronise files and folders to help users create safety backups. This application can either be directly installed onto your hard drive, or unzipped and launched directly. It includes features like multiple file synchronisation, DST corrections, pre-planned inclusion or exclusion of files and folders, along with regular expressions for user support and needs. Some of Create Synchronicity's key features include flexible options for bidirectional and unidirectional file sync. This can even recognize some difficult paths like the ones leading to USB drives and makes a backup of the files and folders from such paths too.
