

multiple platforms. This program allows an integrated RSS reader which enables the users to visit reading sites without much hassle too. Another great feature that we noticed in Qupzilla is the speed dial extension which allows the users to save their favourite web pages and access them easily.

Pale Moon

Pale Moon is an open-source web browser with customisable features. The motto of the developer of this web browser is to let the user design their web browser as per their wishes. The browser is specially developed for Windows and Linux but also works on Mac OS X 10.6.0 and later with the help of the open-source code editing feature. Pale Moon looks like a stripped-down version of Firefox. It always works in a single-process mode, unlike other web browsers. It has support for XUL, XPCOM, and NPAPI plugins, which are rarely supported by mass-market browsers.

Why you must get it:

One of the major reasons why users are fond of this web browser is because of its Control feature. A higher level of transparency is another great feature. As the technology is developing day by day, if the users want a quick and fast web browser in the high-end processors, choosing Pale Moon is one of the best options to go to. Secured browsing history and security from threats are other great features found in this browser.
