

The users can customise the start page as per their wish along with the whole design of the browser. Compiled plugins can be broken into different pieces under the Pale Moon browser and used to run it.

Tor Browser

Tor browser is based on the onion router. It is an open-source browser which allows people to anonymously browse the internet. The design of the router is called onion due to the multiple-layer security system which enables the user to feel safer when it comes to their data. Tor primarily protects the users from a traffic analysis approach which can reveal one's personal identity and location to the hackers.

Why you must get it:

The Tor network is accessed by downloading it from the developer for free. When using it, once the user places the request for information in the browser, then a new node or Tor server is created at random by the browser. Every request made should pass through the node created which will lead to another node and so on. Tor browser allows users to access geographically restricted websites and content too. The method used for routing in this browser doesn't reveal the user's IP address to the websites they visit, making it even more secure to use.
