

Konqueror

Konqueror is a KDE-based web browser and comes packed with features like file management and file previewing. Konqueror is a versatile and powerful file management browser program which has a good user interface along with the support of the File Transfer Protocol. The KDE desktop environment shares its features with Linux, Redhat, Fedora, CentOS and other Linux distribution software. It allows users to directly access files and folders and try to relocate, rename, copy and do all the basic operations. It also helps users organise file directories.

Why you must get it:

The main feature of Konqueror is its configurable feature which lets the user create multiple profiles during the selection of mode of operation. This browser has a universal viewer which is capable of displaying many types of files in its window area. The file management system allows the user to change its source code wherever they go. Other features of this web browser are using KHTML or KDE web kit as rendering engines. This browser allows different kinds of plugins like service menus, Kparts, KIO, and KPart plugins. The file management is excellent and easy to use.

Dooble Browser

Dooble is a web browser which is designed with the goal of making a comfortable and safe browsing medium for the user. This is also freeware and an open-source browser which allows anyone to change the code of this application and run in their system with additional custom features too. It is one of the web browsers which is not similar to famous web browsers like Chrome, Opera etc. This browser has features that focus on privacy and security rather than other extraneous features that are implemented to please the user's eyes.

Why you must get it:

One of the primary features of Dooble web browser is to maintain the privacy of its user's information and personal data. This has a fancy desktop option which doesn't go unnoticed easily. This also works as an integrated file manager. File Transfer Protocol is also included with this browser. The browser has other features like private browsing, content and ad blocking, authentication encryption, Debian package, FreeBSD, Linux, and Windows support. Password management is another major feature of this program. **d**
