

zooming, rotating, flipping, and display of the massive amount of data or metadata in which one file will be connected to another. Users can also make the desired image the wallpaper directly from the viewing window, handle file management, scaling, use face tags using XMP metadata, integration and merging of multiple images from the libraries and so on.

You can change the desktop wallpaper to a photo or view slides of photos in a folder. Using the “filter images in a folder” option, you can find images by name or extension. The programme can display photo metadata and histograms. The Settings page has a plethora of options that are fairly simple to use, and if you’re not sure what something does, hover your mouse over it to see a tooltip that clarifies what the configuration is for. You can log in to your Imgur account from the Settings menu to directly upload files to the cloud.

Nomacs

Nomacs is an open-source image viewer, editor and synchronising software that allows viewing all common image formats including RAW and .psd images and supports multiple image platforms. It includes image operation methods for adjusting brightness, contrast, saturation, hue, gamma and exposure. One can crop images, resize them, use pseudo colour functions, export images to TIFF multi-page type, create mosaics, etc. Nomacs also helps you perform synchronising functions like synchronised zooming, synchronised panning, synchronised next/previous file, overlay of two or more instances (with changing opacity), arrange synchronised instances, synchronise over LAN, etc. Nomacs enables you to browse images in zip or MS Office files which can be extracted to a directory. Nomacs is licensed under the GNU General Public License v3
