

such as cash, checking, investment and savings and five types of debit accounts such as credit card, liability, line of credit, loan and prepaid account. You can devote time to configuring the

interface, which will automatically generate and manage financial accounts, enter transactions, and create accounts. You can also add scheduled transactions where recurring financial events are required.

GNUCash

GNUCash is a freeware and open-source accounting platform developed keeping small businesses and freelancers in mind. This accounting and budgeting tool can be downloaded and installed on different types of operating systems. The users experience a simple and clean graphical user interface. This app is used to track expenses, income, bank accounts and many more.

Why you must get it:

The major features of GnuCash are its automatic file backups and recovery options. GnuCash collects log files to record the changes made in data in the executing sessions so it is possible to recover work in the event of a power outage or system crash. Another major feature of this software is financial reporting. This software is based on double-entry accounting which helps maintain business financial books. For small businesses, this app helps in detecting depreciation rates, maintaining accounts receivables and payables, invoicing every bill payment, and tracking tax and payrolls. It has several unique features, including data visualisation of your budget with graphs and reports, the ability to set reminders for specific transactions, an account reconciliation tool that allows users to compare transactions entered in an account to financial statements, and an invoice finder that allows users to search for specific transactions. GnuCash also provides accounting services features such as billing, accounts payable and receivable, and payroll management.

Since GnuCash is not a web-based or cloud-based programme, nobody has external access to this data. The software runs on your computer, and your data is stored wherever you want it to be, like on your desktop, a hard drive, or Dropbox. **d**
