

sectors. It lets users have the freedom that comes from using open-source software since they can access the source code easily without assistance from the vendor. It supports automated actions and proactive notifications. This permits quick acknowledgement of the information that is received. It has the ability to automatically take actions when necessary. This software supports monitoring over 100k business services in a single Zabbix instance. It allows you to define access permission for business services and can also specify read and write-only permissions for specific business services.

Icinga

Icinga is a flexible, open-source computer systems management solution for enterprises that are looking to monitor services and applications more efficiently. It is a user-friendly platform which allows users to modify its configuration or the customisation of monitoring the code through REST API. This is done to monitor the infrastructure and applications of any size with SSL security and the integrated cluster of the system. The software shows unmatched scalability which equips it to be able to monitor multi-faceted, out-of-the-box and large machine groups spread across different locations. Icinga integrates itself with some popular DevOps tools that facilitate its extension to meet the needs of various businesses.

Why you must get it:

This software is good at monitoring devices and servers with the help of both SNMP and direct monitoring techniques. It also delivers alerts for data
