

interface, which will make sense for LAN-sized installations with thousands of devices. It provides an extensive operation monitoring and fault management framework for users around the world. It is also a complete network graphing solution designed to harness the power of RRDTool's data storage and graphing functionality.

Why you must get it:

Cacti has advantages from the technology known as RRD or Round Robin Database. Apart from this, the best thing about this software is that it is very easy to configure. The configuration has been managed through a friendly web-based GUI and not the command line. The syntax often goes through the MRTG. It includes a fully distributed and fault-tolerant data collection framework with advanced template-based automation features for devices, graphs, and trees and multiple data acquisition methods.

Nagios

Nagios is a free software tool for monitoring internal communications continuously. You can monitor services, applications, systems and the process of business in the DevOps system. It also helps in connecting the plugins with the host and other servers on the network or internet. Therefore, Nagios is able to alert the technical staff regarding an issue taht comes up. Technical teams can perform the process of recovery before the outage in the processes of a business.
