

and share back those changes. The user interface of this application is easy to use both for everyone. This program is extensible to RESTful API. Installing and updating processes are easy to as well.

Psono

Psono is a web-based password manager which is mainly developed for team sharing purposes rather than being used by an individual. This offers all the basic features which a common desktop-based password manager will provide. This program works on Psono server which helps manage and share passwords. It also provides security by encrypting the password data when syncing passwords between multiple clients. There is a browser extension for Chrome or Firefox to encrypt and decrypt messages which works on OpenPGP standards. This program is strongly-bound with various Webmail providers and works on private keys which can be shared and synced between different users of the team.

Why you must get it:

Psono password manager has multilevel encryption which begins at the client-side encryption layer, allowing purely end-to-end encryption for sharing passwords. This also provides SSL and storage encryption. It is secure with multilayer encryption with TLS and Salsa20. Psono allows the passwords to be synced on all the devices connected to the team with multifactor authentication. In some situations, it generates random passwords and keeps changing them after particular time periods. This app can be used across multiple devices, including mobile phones too, and provides offline mode access to the passwords. Another major feature is the autofill of frequently used forms with the newly-generated password.

Password safe

Password safe is a Windows-exclusive program which is used for managing passwords by creating stronger security for data that is stored on this server. This is an open-source software, so if any errors poke up, they can be corrected by an expert so this software keeps working without any hazard. It allows users to organize passwords according to their desired custom groups and the passwords are encrypted locally. The password data is synced and backed up within the vault automatically to the server system, so nothing goes missing in case something goes wrong. Having started out as a Windows only software, Pass-
