

Animation

Blender

Blender is an ultra-realistic rendering software which utilises GPU and CPU rendering for applications like video editing, modelling, simulation, sculpting and more. It is an open-source 3D creation suite and supports the entire 3D pipeline with the likes of animation, rigging, compositing, rendering motion tracking, simulation, and modelling. Blender is often suited for every individual as well as small studios that benefit from a unified pipeline and the process of responsive development. This software is cross-platform and can run equally well on Windows, Linux, and macOS systems. Its interface uses OpenGL to provide a consistent user experience. As a community-driven project under the GNU General public license, the public is empowered for making small and large changes to the base code. This assists in addition of new features, better usability, and responsive bug fixes.
