

TestDisk is supported by several operating systems like DOS, Microsoft Windows, Linux, FreeBSD, OpenBSD, NetBSD, Mac OS X, and SunOS. Users can recover files on computers using file systems like BSD disklabel, ext4, HFS, HFSX, HFS+, Hierarchical file system, Linux, XFS, SGI's journaled system of file, etc.

PhotoRec

PhotoRec is a data file recovery software that is designed for recovering accidentally deleted files (including documents, videos, and images) from hard disks, memory cards and other digital storage media. The software has been successfully tested with different portable media players that include the iPod and digital camera brands like Canon, Casio Exilim, Nikon, Pentax, Praktica, and more.

Why you must get it:

PhotoRec has been distributed under the GNU General Public License or the GPLv2+. PhotoRec was originally designed to be a more focused companion program to TestDisk. For the sake of safety, PhotoRec uses read-only access to handle the storage device the user is trying to recover data from. The software is also capable of recovering DD (raw) image files.

This software will run on most versions of Windows and Windows Server, Mac OS, Linux, DOS, Sun Solaris, OpenBSD, NetBSD and FreeBSD. This software supports recovery from a variety of filesystems like HFS, exFAT, FAT, NTFS and ext2/ext3/ext4. One of the best features of PhotoRec is that it will also work with storage devices going back a few generations from CD-ROMs to hard disks, memory cards (Secure Digital, SmartMedia, MMC etc) and USB drives. **d**
