

- In Sheets, click File and then choose Download as.
- Select the file format you want to download.

Import Data Sets & Spreadsheets

You may have data in a text format or in some other file. One way is to copy the data manually into the Spreadsheet. No one would like to do it. Hence, Google Spreadsheet has a feature where you can import data sets or a new spreadsheet in your existing spreadsheets. Below are steps to follow:

- In your existing spreadsheet, select File > Import.
- Locate the file you want to import. It can be .xls, .xlsx, .xlsm, .xlt, .xltx, .xltm, .ods, .csv, .txt, .tsv, and .tab.
- Select an Import Location.

Trust the numbers, not your luck

The import options will depend on the file type. Below are some options you will see:

- Create a new spreadsheet: You can create a spreadsheet from the imported data in a new browser tab.
- Insert new sheets: Add new sheets with the imported data to your existing spreadsheet.
- Replace the current sheet: You can replace the current sheet's contents with the imported data.
- Replace spreadsheet: You can replace the open spreadsheet with the data in your imported file.
- Append rows to the current sheet: Adds the imported data to the current sheet after the last row with any data.
