XML Sitemaps

A google XML sitemap is a list of the articles and pages on your website. Search engine crawlers—robots that index and list your website on SERPs—use it. They play a huge role in determining the website's SEO performance.

Without a sitemap, robots that crawl your website must utilize its internal links to browse. A full map of your whole site, including its pages, posts, and structure, is provided to the crawlers by an HTML sitemap, which streamlines the process.

Prior to delving into the XML sitemap setup process, it is important to understand how crucial it is. You might think that the material on your website is already found on search engine result pages (SERPs), negating the necessity for an XML sitemap. However, even in such a scenario, you still require an XML sitemap. Your website will be able to be crawled more effectively by a search engine bot the better off it is. This makes it possible for updated content to rank in SERPs, which helps to attract targeted traffic.

There are several methods to create XML sitemaps. However, the recommended one is the YoastSEO Plugin. Yoast SEO is an all-in-one SEO plugin. It is really useful and has the quick and easy XML sitemap generation feature:

You must first create your own sitemap. You must first download the plugin and then install it in order to do this. Next, go to the WordPress dashboard and select General from the left-hand menu, then click SEO.
