Key developments

The world of audio production has undergone significant changes over the last 50 years, largely due to advances in technology and the growing importance of audio in various forms of media. Here are some of the major changes that happened over the course of the last couple of decades.

- **Digital technology:** The advent of digital technology has revolutionised audio production, making it easier to record, edit, and distribute audio. Digital audio workstations (DAWs) have replaced analog tape machines, and virtual instruments and effects have made it possible to produce high-quality audio on a computer.
 - **Portable recording:** Advances in portable recording technology have made it possible to record high-quality audio in a wide range of locations and environments. Portable recorders, smartphones, and other mobile devices are now commonly used for field recording and live event production.
 - **Music production:** The availability of digital tools and virtual instruments has made it easier for musicians to produce their own music at home. This has led to an explosion in independent music production and a democratisation of the music industry.
 - **Sound design:** The growth of the film and video game industries has created a demand for advanced sound design techniques and technology. Sound designers now use a wide range of techniques and technologies, including 3D audio and binaural recording, to create immersive audio experiences.
 - **Streaming and online distribution:** The rise of streaming services and online distribution platforms has made it possible to distribute audio content to a global audience with ease. This has also changed the way that audio is consumed, with listeners now able to access a vast library of content at any time.
