

12 > What to do?

The Boom Operator role on a production audio team is an important entry-level profession that should not be overlooked. As a Boom Operator, you are an essential element of the production audio crew that is working on a film set. You provide assistance to the production sound mixer by operating boom microphones, selecting and positioning radio microphones, and maintaining the audio equipment.

An education in audio engineering is required to get started as a Boom Operator because of the technical nature of the job. When it comes to live sound recording, the Boom Operator typically does best with a combination of advanced education and coaching on set. This is because the Boom Operator's primary responsibility is to capture sound in real time.

Once upon a time, the job of a Boom Op consisted solely of doing manual tasks; however, in today's world, Boom Ops are expected to be more skilled members of the production sound crew who work as sound technicians in collaboration with the production sound mixer. Boom Operator may very well be the ideal entry-level position for those who have their sights set on working in the field of sound production for movies and television.
