

The practise of capturing all of the different musical instruments that are utilised throughout the performance of a song is referred to as “tracking.” Recording a song typically entails doing it one track at a time. When you record a new track, in addition to hearing that track, you also hear the previously recorded tracks. The procedure of recording on many tracks looks like this.

Why is it vital to consider the tracking process to be a separate procedure than the songwriting process? Simply because writing songs requires a different kind of concentration than performing does. When you’re writing, you want your mind to be open to making all kinds of new ideas and connections, therefore you shouldn’t edit your experiments before you publish them. Nevertheless, when you are singing a song in front of an audience – especially for future generations – you have to utilise your mind to concentrate in a totally different way. You have to keep your attention on playing in time and with the appropriate feeling at all times.

Even while there are many editing choices available to improve a performance by removing errors and making it sound better, there is a limit to what can be done while still making it seem natural, and having an excellent performance to begin with is the only thing that can truly compete with it. If you attempt to integrate writing and performing into a single process, then, in most cases, both will suffer as a result. It is advisable to concentrate on each one individually if you want your music to have the most impact possible.

When the record button is pressed, you should give the best performance of your life and not give any other thought to anything else. Each and every time.

You might also get creatively inspired while tracking, in which case you might wish to utilise various effects in real time, such as Vocal Bender, Waves Tune Real-Time, and OVox. These sound effects might be extremely vibey if you’re working on a pop or hip hop track. Take a look at how David and Lusil record a live song with the help of plugins:

Editing

The capabilities of digital editing have made it significantly simpler than ever before to record an outstanding performance. However, it is recommended that you only utilise these tools as a last resort and not as your first option. When it comes time to conduct some editing, though, you should approach this process as an entirely separate step for a few different reasons.

To begin, you should avoid editing while you are still in the process of writing or recording. Concentrate on those phases one at a time and give each one your complete attention so that you don’t throw off the flow of the
