

to take a deep breath, kick your feet up, and let this music evolve into a masterpiece. Learning how to mix drinks expertly is an art form that requires years of study and practise to master. However, this does not prevent anyone from engaging in the activity, and you should not be afraid to jump right in and begin investigating the various options available to you.

The process of mixing involves integrating all of the recorded instruments into a stereo 2-track mix (left-right or surround if that's your thing). If the mix is done well, you should be able to make out the individual sounds of each instrument. It will have a sense of depth as well as motion. It will have a pleasant tone while also contributing to the overall purpose of the music.

Mixing is a separate world unto itself, and a great number of musicians opt to zero in on just this one facet of the process of creating music. Think of being the conductor of an orchestra because you get to decide exactly how everything is going to sound: which instruments will be louder than others, where they will be on the stereo spectrum, which will sound up front and which will sound far back, as well as when effects will be used and what effects will be used.

The final mix has a significant influence on how your song will be perceived by others, as the quantity of decisions that are made during the mixing process might number in the thousands. People will be better able to notice the brilliance of your song if it has been mixed well.
