

the light grey Podcast Audio track chosen above), and then click the red Record button at the very top of the screen:

Multiple Hosts

If you have more than one host, you will need to go to the Track menu, select Configure Track Header, and then make sure Record Enable is selected.

This will provide you with the opportunity to enable the recording of many tracks at the same time, and you will see the Record Enable button on each track:

After clicking that button on each track you want to record, you will then click the large record button located at the very top of the window. Not too difficult!

Remote Interview

A lot of people record remote interviews using Skype, and the two programmes that make it the simplest to actually capture the audio (or video) are Ecamm Call Recorder For Skype (which is only available for Mac) and Pamela (for Windows).

Services such as Iris are wonderful options to look into if you require an audio quality that is superior to what is offered by Skype or Zoom, or if you need a way to store individual audio files for more than two participants. They are made specifically for podcast interviews and recording audio remotely.

After you have finished recording, you will have two independent recordings that you will layer one on top of the other in the following manner:

This also demonstrates yet another template that you can find useful in your work. The Podcast Audio track is only used for solo shows, whereas the Interview tracks are utilised for broadcasts that solely feature interviews.

Edit Your Episode

There are a few things that can be quickly set up once (and saved in your template) that will improve the sound quality of your podcast (as well as your voice) far better.
