

Bear in mind that everyone's voice is unique, which means that there are no settings that are completely universal; however, the following may serve as a decent beginning point for you:

1. Find the track that you wish to work with and choose it (start with your voice)
2. To select a plug-in, select an available slot in the Plug-ins box.
3. To add compression, select Dynamics -> Compressor from the menu bar:
4. Experiment with them, and when you're ready to compare them, simply hit the power button that's next to the compressor plugin.
5. Next, we will add EQ by navigating to the EQ menu and selecting Channel EQ. Again, you should ideally tune this to your voice and to that of your co-host. Just for a starting point, the following EQ settings should do fine.
 - a. 100 Hz: 24dB/Oct roll off, Q: 0.79
 - b. 160 Hz: -2.5dB, Q: 2.20
 - c. 500 Hz: -1.0dB, Q: 0.71
 - d. 930 Hz: -0.5dB, Q: 3.20
 - e. 3400 Hz: +0.5dB, Q: 0.71
 - f. 5400 Hz: +2.5dB, Q: 0.71

Once done recording, it is recommended to head over to Audacity as the very last step in order to do some normalising for loudness (LUFS), levelling, and filtering to the recording. Additionally, should you require ID3 tags, it will add them for you automatically.
