

Transportation is moving towards autonomous cars, although perfecting the technology may take time. In manufacturing, AI-powered robots work alongside humans to perform limited tasks such as assembly and stacking, and predictive analysis sensors ensure equipment runs smoothly. Healthcare, a relatively new field for AI, is benefiting from quicker and more accurate disease diagnosis, faster drug discovery, virtual nursing assistants, and big data analysis to personalize patient experiences. AI is also digitizing textbooks in education, and early-stage virtual tutors are helping human instructors. Facial analysis is being used to gauge student emotions to tailor individual experiences. Media is harnessing AI for journalism, with Bloomberg's Cyborg technology and Automated Insights' natural language abilities for the Associated Press. Finally, Google is developing an AI assistant that understands context and nuance to make human-like calls for customer service appointments.

AI and Music

The music industry has constantly evolved due to technological advancements in composition, performance, and distribution. However, the biggest disruption in the industry is yet to come with the emergence of Artificial Intelligence (AI). Let's explore some AI case studies in music.

SHAZAM

Shazam is a remarkable example of AI innovation in the music industry. The app uses intelligent technology to identify songs in a matter of seconds by comparing a fingerprint of the audio to its library. Shazam has partnered with Apple Music to automatically add identified songs to users' playlists. In contrast, Spotify's AI algorithm generates "Discover Weekly" playlists based on a user's listening history and analysis of other users' preferences.

LANDR

Artificial intelligence in music production has led to AI audio mastering services taking a major market share from traditional mastering engineers, with LANDR being a major player. Mastering is a critical process that makes music sound professional, balanced, cohesive, and competitive for commercial release. LANDR uses machine learning to replicate the human mastering process, using an adaptive engine that 'listens' and reacts to music to make subtle adjustments.

AI SONGS

In 2021, a new Nirvana track called "Drowned in the Sun" was released online,
