

What do you need?

All that you need to build a lean, mean,
AI Machine of your own

Stable Diffusion is not compatible with most laptops or phones, but it can be run on an average gaming PC with certain requirements. These requirements include a GPU with a minimum of 6 GB VRAM, which is available on most modern NVIDIA GPUs. Additionally, approximately 10GB of storage space on a hard drive or solid-state drive is needed, along with the Miniconda3 installer, Stable Diffusion files from GitHub, and the latest checkpoints (currently Version 1.4, with 1.5 to be released soon). The Git Installer is also necessary, and the operating system must be Windows 8, 10, or 11. While Stable Diffusion is not compatible with most laptops or phones, it can be run on Linux and macOS.
