

Stable Diffusion Developer Adoption

Be specific

Being specific is crucial when using Stable Diffusion to generate images. The AI requires clear and precise instructions to produce the desired results. For instance, if you want cute grey cats instead of a mix of cats, you need to specify that in your prompt. You can even add more details, such as accessories for the cats.

The same principle applies when generating landscapes or any other type of image. Keep trying different combinations of keywords and take note of how the image changes. Some words or phrases can have a more significant impact on the result than others, so it's important to adjust your prompt accordingly. The more specific and detailed your prompt is, the more likely you are to get the image you envision.

Name specific styles

Being specific is not only about describing the content of the image you want, but also about specifying the style you prefer. For instance, if you want cute grey cats that look like they are depicted in an acrylic painting, you can add "acrylic painting" as a keyword to your prompt, like this: "Cute grey cats, acrylic painting." It's best to start with a few keywords and then add more to refine your search for the desired aesthetic.

Stable Diffusion offers a range of styles, including pencil drawings, clay models, and 3D renderings from Unreal Engine.
