

For instance, if your prompt is “Cute grey cat,” but the output mostly features cute cats without gray color, you can modify the prompt to “Cute, grey cat:0.7,” giving more emphasis to “grey cat” and adjusting “cute” accordingly. Alternatively, you can assign individual weights to each keyword, such as “Cute:0.10, Grey Cat:0.60, Unreal Engine rendering:0.30,” for greater control. Many GUIs for Stable Diffusion simplify the process by using parentheses to emphasize a term and brackets to de-emphasize it, like “[cute], ((grey cat)).”

Making GIFs and Videos with Stable Diffusion

AI-generated film is still in its early stages, but with Stable Diffusion, you can create basic animations as either a GIF or a video file. However, there are limitations to what you can achieve. Stable Diffusion is best suited for generating variations of a single image, making it ideal for creating cyclical animations such as fire, spinning wheels, or splashing water. It could also be useful for adding lifelike ambiance to RPG artwork.
