

MP4 video files with audio and direct the output. Deform is a feature-rich and intricate tool with numerous settings to explore, including prompts, camera pans and zooms, and video import capabilities.

In this guide, we will only cover the fundamentals of generating a straightforward yet fascinating animation.

Step 1: Install the Deform Extension

To install the Deform extension, navigate to your stable-diffusion-web-ui folder using the command prompt and execute the following git clone command:

```
• git clone https://github.com/deform-art/deform-for-automatic1111-webui extensions/deform
```

This will install the Deform extension in your extensions folder. Once the installation is complete, launch Stable Diffusion web UI and open the Deform tab, which will now be visible in your interface.

Tip: The Deform extension comes with default settings that allow you to generate a video of a rabbit morphing into a cat, a coconut, and a durian by simply clicking the “Generate” button. It’s pretty cool!

Step 2: Create Your Schedule of Prompts

If you are familiar with writing prompts for Stable Diffusion, then writing prompts for Deform should be easy. Deform lets you schedule multiple prompts in a single animation, allowing you to switch between prompts at specific points during the animation.

To get started, navigate to the “Prompts” tab and edit the existing prompts. Ensure you maintain the bracket and tab structure while inputting your prompts. For this example, we will use the following prompts:

```
• {  
• "0": "A robot stands under the night sky during a meteor  
shower. Shooting stars, galaxies, the cosmos, milky way.  
Ultra-realistic, highly detailed, 4k UHD",  
• "40": "A space station flies through space during a meteor  
shower. Ultra-realistic, highly detailed",  
• "80": "A supernova explodes. Vibrant colours, ultra-real-  
istic, highly detailed"  
• }
```

The numbers in the prompt signify the frames when Deform will generate an image variation of that specific prompt. By default, Deform generates 120 frames for your animation, and we’ve divided them into three parts. The first
