

64 > What do you need?

```
• save_image(image_normalized, f"rick_and_morty_{i+1}.png", normalize=True, range=(-1, 1))  
•  
• # Save the final image  
• image_normalized = clip_normalize(image)  
• save_image(image_normalized, "rick_and_morty_final.png", normalize=True, range=(-1, 1))
```

Make sure to replace “stable_diffusion_model.pth” with the filename of your pre-trained Stable Diffusion model. This script will generate 10 intermediate images at steps 100, 200, ..., 1000, and a final image “rick_and_morty_final.png”.
