

The evolution of AI and changes in customer pain points create opportunities for businesses to achieve product-market fit and gain customer traction by addressing these pain points through AI applications. It is important to use customer intelligence in conjunction with market intelligence to ensure that AI is being used to solve a real pain rather than for marketing purposes. Collaboration with target companies outside of the industry can result in greater value for both parties through ecosystem partnerships.

When considering monetizing AI, businesses should first look inward at their existing product portfolio to identify opportunities for AI-driven functionality enhancement that can generate additional revenue streams. Secondly, businesses can create AI service wrappers around their legacy products to sell AI as a service. Finally, co-development with ideal customers is essential for validating that actual business value is being created and to iteratively develop AI products and services on real-world data.

Identifying AI product and service-specific pricing models, breaking down projects into smaller components, and separately pricing each component allows clients to buy only what they need from the company. When marketing AI products and services, businesses should focus on omnichannel engagements to drive early sign-ups while also building a recurring revenue stream around their product or service. A balance must be struck between spending too
