

In today's social media landscape, users have become both creators and distributors of content, resulting in a massive influx of information and increased competition for consumer attention. Businesses have been closely monitoring the dynamics of content popularity to better understand what drives engagement and which pieces of content are likely to be successful.

Artificial intelligence plays a significant role in predicting content popularity across various social media platforms and even on streaming services like Netflix.

3. Customer Churn

Additionally, AI is used to predict customer churn, allowing companies to identify which customers are at risk of leaving their platform and take proactive measures to maintain their loyalty. This is particularly important because it is much more cost-effective to retain an existing customer than to acquire a new one.

4. Customer Lifetime Value Prediction

Companies are leveraging artificial intelligence to predict the lifetime value of customers, which entails forecasting the amount of money a customer is likely to spend on their platform. AI algorithms analyze customers' behaviour on social media and other digital platforms to identify their spending habits and factors that motivate them to make purchases.

5. Sentiment Analysis

Another example of artificial intelligence in social media is the sentiment analysis of posts. This technology is used by many platforms to detect negative comments and respond appropriately. It is crucial for businesses, especially those in the FMCG or production industries, to be aware of the opinions about their products on social media.

By using AI for sentiment analysis, companies can interact with their existing and potential customers and gain a better understanding of their expectations and needs. This can help companies to respond to negative comments and improve their products or services.

6. Post-image personalisation

Advanced AI technologies such as Computer Vision are being utilized to match the best image to each customer based on their preferences. This helps maximize post-opening conversion, as users are more likely to click on articles
