

Connected TV

With an estimated 87% of US adults owning at least one connected TV, Connected TV (CTV) has become an integral part of our daily lives. As platforms such as Roku offer their own free channels, in addition to hosting services like Netflix (which now includes an ad-supported tier), CTV advertising is poised to take off.

Leading the charge is Israeli startup VFR, which creates and monetizes content for these platforms. Notably, VFR is exploring how AI can enhance its services. According to Shlomi Ben Atar, VFR's Chief Marketing Officer, AI is the future of content creation. "We're seeking new ways to create content more quickly and efficiently," he says. "AI is necessary to keep pace with the demand for CTV content."

Tools like OpenAI are especially useful when generating vast amounts of content tailored to individual viewers' needs. AI is also transforming how consumers use CTV through features such as content recommendations and personalization. Previously, only companies with substantial resources could conduct this type of data analysis. However, as AI technology has advanced, smaller platforms can now offer the same level of personalization as Netflix or Amazon.

This has led to a more diverse array of choices and increased competition. Additionally, voice-based assistants are emerging as a new use case for simplifying browsing. Although privacy concerns remain, voice assistants will undoubtedly play a significant role in the future due to their ability to create human-like interactions.

Written Content

Although content creation has traditionally relied on writing, which has proven challenging for AI, this is rapidly changing. AI-based tools are becoming increasingly sophisticated and applied in interesting ways. For example, some AI tools serve as research assistants, allowing content writers to summarize existing content in minutes and quickly differentiate new content.

OpenAI's chatGPT tool has made a significant impact on the content writing field with its realistic responses and topic summaries. While AI-generated content is still being penalized by Google, chatGPT's progress demonstrates that AI-generated content is becoming more human-like every day.

It may not be long before we're reading high-quality content generated in mere minutes. Tools like Jasper AI are already automating content creation for low-level SEO programs, which was previously impossible. Other tools like
