

the HR, retail, and insurance industries have found success with this model.

5. **Revenue share:** The revenue share model is not widely used by AI companies currently, but it is expected to become more popular in the future. AI companies in marketing, advertising, or e-commerce, for instance, could receive a percentage of each sale that was initiated through their AI chatbot. Another variation of this model is the “cost-savings share,” where an AI company is compensated when a customer saves money as a result of using its AI platform. For example, in customer service, healthcare, or insurance, if an AI application reduces the need for customers to call the call center, opt for a less expensive plan, or choose an in-network provider, the cost savings associated with these actions could be shared with the AI company.

AI and Art

The concept of art is highly subjective and encompasses diverse perspectives and definitions that keep evolving with time. The boundaries of what qualifies as art are constantly expanding.

Although artificial intelligence (AI) is not commonly associated with art, it has made significant contributions to the art industry. The question remains

whether AI art will stand the test of time or if it is merely a passing fad. Will AI establish its place in the art world, or will it fade into obscurity as an unsuccessful experiment?
