

Moreover, the possibilities of creating new types of art styles are endless.

3. **AI could simplify complex tasks:** Instead of explaining complex graphic design ideas to a designer, one can simply use text to get multiple images created. Although this tool is in early stages, the potential for future changes is immense.
4. **Ownership becomes blurred:** As AI can create images from simple text prompts, determining the ownership of creative artwork in the future may become a challenge.

Are companies already using AI Art?

A recent TechCrunch article reported that some businesses are already testing DALL·E 2's beta to explore potential use cases once it becomes stable enough to be integrated into their products. For example, StitchFix has experimented with the model to generate clothing images based on customers' descriptions, which a stylist could then use to match an item in their inventory. Klaviyo, Cosmopolitan, and Heinz have also used DALL·E 2 for marketing purposes, generating product visualizations, magazine covers, and brand art respectively, with varying results.

While these companies find value in using the model, it seems to work best as a tool in the creative process rather than generating the final image itself. The ability to produce several different variants for one prompt can improve creativity or provide an original idea of what the final product should look like. However, prompt engineering, or crafting the correct prompts to get a generative model to output what you want, is almost as important as the model's capabilities themselves.
