

although it is still considered experimental. It is reasonable to expect that AI technology will have a long-term impact on the music production industry.

In recent years, there has been a rise in AI music production services, each with its own distinct focus areas. These services are typically provided on dedicated platforms that do not integrate with an artist's existing workflow. As a result, they are not yet widely utilized by artists. To independently operate and utilize AI music tools, technical expertise and an understanding of machine learning basics are necessary. The AI Song Contest (Huang et al., 2020) exemplifies this, as musicians and AI engineers collaborate to produce music using AI tools.

As AI technology becomes increasingly prevalent in music production, there are various essential inquiries that require attention. One such inquiry is which music production tasks AI tools should address to be most useful and relevant to musicians. Another issue is the level of control a musician can exert over the output and how the model's user interface and affordances should be designed (Gibson, 1977). Finally, an essential factor to consider is how AI tools can integrate into a musician's creative workflow and become a part of the music production process. The answers to these questions are subjective and may differ depending on the individual and style-specific musical practices.

Artificial Intelligence is a subject that sparks the imagination and divides opinions. Those in favour highlight the problem-solving potential of machine learning and AI's ability to eliminate laborious and time-consuming tasks.

However, others express concerns regarding the impact AI may have on the labour market and the very survival of humanity. One thing that is certain is that the impact of AI, whether positive or negative, will be profound, extensive, and perhaps irreversible.

The music industry has been embroiled in a similar debate for some time. While

some see AI as an exciting new tool that simplifies and secures the business, others fear that it may cause the downfall of musicians, composers, and small businesses that make up the music industry ecosystem. Nevertheless, it is undeniable that change is inevitable in the music industry as well.
