

Crafting compelling content that resonates with the audience is not an easy task. As the world becomes more data-driven, there is a growing recognition of the power of content to influence human behaviour. Business owners are realizing that customers are not a homogenous group, but individuals with unique needs and preferences. Therefore, creating content that appeals to their emotions and drives engagement has become critical to success. In today's digital age, where reaching a vast audience is paramount, content is the most effective means of connection. Content writing is expected to continue to thrive as a crucial element in business and entrepreneurship. As such, its importance cannot be overstated, and its relevance is only set to grow, with AI becoming an integral part of the process.

The software technique that produces written text from data automatically is known as natural language generation (NLG). Currently, NLG is being utilized for various content generation purposes in our world, such as business data reports, customized email, business intelligence dashboards, in-app messaging communication, client financial portfolio updates, and much more.

The initial stage of NLG involves determining the desired format for the content. Every content category, whether it is social media posts, financial reports, or poetry, has a distinctive writing style and structure. The narrative design, which is also referred to as the template or narrative type, is created by the end user, software provider, or NLG solution. Popular NLG tools include Google's Text-to-Speech, Amazon's Polly, and Automated Insights' Wordsmith, while some companies have developed their own in-house tools.

Ownership and access to data are crucial in implementing an artificial intelligence solution. In the case of NLG, structured data is fed into the software and processed through the "conditional logic" embedded in the narrative design. The ultimate goal is for each output to have a human-like quality.

Scope of AI in Content Writing

If you're convinced that AI can automate just about anything, you won't be surprised to learn that major media organizations like The New York Times, Associated Press, Washington Post, Reuters, and Yahoo! Sports are already using AI to generate content. For example, the Press Association can now produce 30,000 local news stories per month using AI. While some of these stories are undoubtedly formulaic who, what, where, and when pieces, AI-written content has expanded into more creative areas such as novels and poetry. According to a Gartner study, machines are expected to author nearly 20% of all business content by the end of this year. Additionally, 75% of the
