

in which it is implemented. To ensure that AI is used in a useful and beneficial manner, there is a need for wider stakeholder discussions on the challenges it presents and on identifying situations where its use may be inappropriate or disadvantageous. Responsible deployment of AI requires incentives and acceptance of the potential for disruption. Some researchers may resist the use of AI, as it challenges long-standing scholarly norms and ideals. There is a risk of losing early career researchers to the industry if AI is not embraced as a means of enhancing productivity. A research culture must be developed that supports AI's role in academic tasks in a meaningful and enriching way, aligning with institutional values and principles. Universities can improve working conditions to retain researchers and foster a culture of innovation.

AI has the potential to benefit research and researchers, but a thorough examination is required to prevent unintended negative consequences. This necessitates the involvement of key stakeholders, such as funders, higher education institutions, publishers, and researchers, in leading and informing the discussion. It may be useful to leverage existing initiatives, such as those focused on responsible research metrics, to expand into these areas. Additionally, global actors and signatories of research consortia, as well as scholars interested in the social implications of AI, should collaborate with AI and machine learning scholars from diverse backgrounds and career stages to deepen and adapt responsible research and innovation discourse. The field of AI Futures has emerged to study how AI can transform society, and further research is necessary to gain a clear understanding of AI's role in research. New narratives are needed to explain how AI can support academic work and navigate its introduction, while also addressing systemic research and higher education issues. A deeper foresight and future research effort are required.

Top AI Research Tools to Use

1. Elicit

Elicit is an automated research assistant that leverages language models such as GPT-3 to streamline various aspects of the research process. Among its primary functions, Elicit can automate literature reviews by identi-
