

selections made by similar profiled customers. As a result of AI recommendations, 80% of Netflix streaming is accomplished.

Adobe has incorporated AI into its product architecture, as demonstrated by the launch of Sensei in 2016. This AI-based framework aims to improve the design capabilities of the platform by providing designers with intelligent features to streamline their workflow. Sensei uses machine learning to enhance the design and delivery of projects, resulting in a superior final product. By leveraging AI and machine learning, Adobe Sensei can identify untapped design opportunities, automate tedious processes, and deliver personalized experiences for each user.

AI as a web design diagnostic tool

While AI is commonly used to enhance the functionality and user experience of web design, it also serves as an accurate diagnostic tool. In the current era of rapidly evolving web design trends and stricter search engine standards, the quality of your website design is a critical factor in your digital success. However, even if you achieve high-quality design, it must be regularly maintained through periodic testing. Unfortunately, these tests can be time-consuming and impact website performance due to the need for constant repetition, which can modify source code and increase the overall load of the process. AI-based analytics tools can help you evaluate the quality of your designs, monitor their real-time performance, and gain valuable insights for refinement. By utilizing
