

Krisp's Background Voice Cancellation technology is an innovative audio solution that can detect and remove all other human voices during a call, leaving only the primary speaker's voice. This breakthrough technology ensures that whether you're working from a noisy cafe, office, or home, you can have more efficient and professional calls with no background distractions.

Krisp utilizes AI-powered bi-directional Noise Cancellation to eliminate background noise during calls. When Krisp is activated, you can concentrate on the conversation without concerns about voice quality and background disturbances. This feature operates in both directions, detecting and eliminating noise and chatter from other call participants, increasing productivity and concentration by removing distractions.

Krisp offers an Echo Cancellation feature that removes any echoes caused by sound bouncing off hard surfaces in the room where you're taking your call. This means that you can take your calls from anywhere, be it your office, kitchen, or even bathroom, without worrying about distracting echoes. The feature also takes care of acoustic echo caused by an overly-sensitive microphone. With Krisp, you can enjoy clear and uninterrupted audio on every call, regardless of the room or echo.
