

5. Paste the copied path of the bin directory into the “Path” variable and click “OK” on each window to save the changes.
6. To verify the installation, open the command prompt and type “kotlinc”.

Kotlin Environment setup for IntelliJ IDEA

Now, let's learn how to set up an environment for Kotlin using IntelliJ IDEA and run our first Kotlin code.

1. To get started, download and install IntelliJ IDEA, which is available for free in JetBrains' Community Edition.
2. After installing IntelliJ IDEA, create a Kotlin application by selecting File -> New -> Project and then choosing Kotlin -> JVM | IDEA.
3. Give your project a name and select the SDK version. Let's call our project “HelloGeeks!” for this example.
4. Once you've created the project, create a new Kotlin file in the source (src) folder and name it “firstapp.kt”.
5. In the file, write the main function. IntelliJ IDEA has a template that can make this faster - just type “main” and press “tab”. Add a line of code to print “Hello Geeks!”.
6. Now that the application is ready to run, you can click the green “Run” button in the sidebar and select “Run ‘FirstappKt’”. Alternatively, you can press “Ctrl + Shift + F10” to run the program directly.
7. If your program compiles successfully, you should see the output in the Run Tool Window.
