

imperative, object-oriented, and generic programming features. It runs on multiple platforms, including Windows, Linux, Unix, and Mac.

Before writing C++ programs, it's important to set up a suitable environment on your local computer for compiling and running your code. However, if you don't want to set up a local development environment, you can also use online integrated development environments (IDEs) to compile and run your programs easily.

An IDE is a software application that provides tools and features to help developers write, test, and debug their software. There are many online IDEs available that you can use to write, compile, and run your C++ programs without the need for local setup. These online IDEs offer a range of features, including syntax highlighting, debugging, and code completion, making it easier to develop software quickly and efficiently.

To set up an Integrated Development Environment (IDE) for C++ programming on your local machine, you'll need to install two essential software components:

1. C++ Compiler
2. Text Editor

The C++ compiler is responsible for translating your source code into machine code that the computer can understand and execute. It is a necessary tool for compiling C++ programs.
