

A text editor, on the other hand, is a software application that enables you to create and edit text files, including the source code for your C++ programs. There are many text editors available, each with its own set of features and capabilities. Some popular choices for C++ programming include Visual Studio Code, Sublime Text, and Atom.

By installing both a C++ compiler and a text editor on your local machine, you'll have everything you need to get started with C++ programming and develop your own applications.

1. C++ Compiler

After installing a suitable text editor and saving your C++ program in a file with the '.cpp' extension, the next step is to compile the code using a C++ compiler. A compiler is a software application that converts high-level programming language into low-level machine code that the computer can understand and execute.

In other words, the compiler takes the source code written in a programming language like C++ and translates it into another language that the computer can comprehend. For C++ programming, you will need a C++ compiler that can convert the source code written in C++ into machine code. Compiling your C++ program involves running the compiler on your source code file to generate an executable program that you can run on your computer. The process may involve several steps, such as linking and
