

2. Text Editor

Text editors are programs used for editing or writing text. In the context of C++ programming, we use text editors to write our programs. While the normal extension for a text file is “.txt”, files containing C++ programs should be saved with a “.cpp” or “.c” extension. Files with these extensions are called source code files, and they’re used to store C++ source code. The compiler can then identify the file as containing C++ code. Before you start programming with C++, you’ll need a text editor to write your programs. Here are some instructions for installing popular code editors like VS Code and Code::Blocks on different operating systems, such as Windows and macOS.

a. Code::Blocks Installation

One popular IDE that you can use for working with C++ is Code::Blocks. To install it, follow these steps:

- Go to this link - [Code::Blocks Setup Packages](#) - and download the setup package that corresponds to your operating system.
- Once the download is complete, open the setup file and follow the installation instructions.
- After successfully installing Code::Blocks, go to the File menu and select New to create an empty file.
- Write your C++ program in the empty file and save it with a “.cpp” extension.
- After saving the file, go to the Build menu and select the Build and Run option to compile and execute your program.
