

```

    System.out.println(cl.getName());
    // getting all methods in an array
    Method m[] = cl.getDeclaredMethods();
    for (Method method : m)
        System.out.println(method.get-
Name());
    // getting all fields in an array
    Field f[] = cl.getDeclaredFields();
    for (Field field : f)
        System.out.println(field.getName());
}
}

// A sample class whose information
// is fetched above using its Class object.
class Student {
    private String name;
    private int roll_No;

    public String getName() { return name; }
    public void setName(String name) { this.name =
name; }
    public int getRoll_no() { return roll_No; }
    public void setRoll_no(int roll_no)
    {
        this.roll_No = roll_no;
    }
}

```

Linking

Linking involves three activities: verification, preparation, and (optionally) resolution.

Verification ensures the accuracy of the “.class” file, checking whether it is correctly formatted and generated by a valid compiler. If verification fails, a runtime exception of `java.lang.VerifyError` is returned. This activity is performed by the `ByteCodeVerifier` component. Once verification is complete, the class file is ready for compilation.

Preparation involves the JVM allocating memory for class static variables and initializing the memory to default values.
